Though Japan has successfully competed with U.S. companies in the manufacturing and marketing of computer hardware, it has been less successful in developing computer programs. This book contains the first detailed analysis of how Japanese firms have tried to redress this imbalance by applying their skills in engineering and production management to software development. Cusumano focuses on the creation of "software factories" in which large numbers of people are engaged in developing software in cooperative ways--i.e. individual programs are not developed in isolation but rather utilize portions of other programs already developed whenever possible, and then yield usable portions for other programs being written. Devoting chapters to working methods at System Developing Corp., Hitachi, Toshiba, NEC, and Fujitsu, and including a comparison of Japanese and U.S. software factories, Cusumano's book will be important reading for all people involved in software and computer technology, as well as those interested in Japanese business and corporate culture. Global Production and Trade in East Asia focuses on the profound change that the traditional paradigm of production and international trade has undergone in the last two decades or so as a result of worldwide trade and investment liberalization. This ongoing transformation has been both aided and stimulated by advances in telecommunications, transportation, and information management. The liberalization of trade and

investment on the one hand and advances in communications technology on the other have further promoted global production networks in which vertical stages of final goods are fragmented across countries. International fragmentation of production, which enables international division of labor not only in final products but also in vertically related components, is more evident than ever before. The book documents the process of international production fragmentation and trade in East Asian economies, studies the mechanics of the process, explores the theory behind the phenomenon, and identifies important policy implications. It focuses on production fragmentation and trade in East Asia because this is the part of the world where the phenomenon is most visible. With contribution by well-known international economics scholars from North America, Europe, and the Asia-Pacific, the book distinguishes itself with high global quality and rich regional content. It achieves a fine balance between theory, policy, and empirical work. This book will interest scholars of international trade, foreign investment and international business, regional specialists in East Asian economies, policymakers and advisors in international economic relations, and anyone else who follows important economic issues of globalization.

Drawing on extensive research, this book explores the techniques that old computer games used to run on tightly-constrained platforms. Retrogame developers faced incredible challenges of limited space, computing power, rudimentary tools, and the lack of homogeneous environments. Using examples from over 100 retrogames, this book examines the clever implementation tricks that game designers employed to make their creations possible, documenting these techniques that are being lost. However, these retrogame techniques have modern analogues and applications in general computer systems, not just games, and this book makes these contemporary connections. It also uses retrogames' implementation to introduce a wide variety of topics in computer systems including memory management, interpretation, data compression, procedural content generation, and software protection. Retrogame Archeology targets professionals and advanced-level students in computer science, engineering, and mathematics but would also be of interest to retrogame enthusiasts, computer historians, and game studies researchers in the humanities.

This book provides an authoritative overview of the global development of surgical paediatrics. Biographical accounts of key people who developed this relatively new specialty, many of whom are now household names, are presented. The compendium also acknowledges the enormous contribution of imaging (ultrasound/MRI and PET scans), minimal invasive surgery, and fetal surgery, as well as the role of related journals and associations, in the progress of surgical paediatrics. Many of the contributors have been instrumental to the development of surgical paediatrics in their respective countries, and have considerable worldwide influence on the management of children requiring surgical care.
